

## iPad Tips & Tricks – Camera Focus & Zoom

The camera app allows you to take still photos and videos quickly and easily, but you can also focus the camera for more accurate stills.

When using the **Camera** app, tap the screen where you would like to focus. This brings up a small blue square showing the area the camera is now focused on. You can also pinch your fingers apart to zoom in, but be aware that this will reduce the quality of the picture.

A photo is only captured when you lift your finger off the button. This means you can line up the shot and get yourself steady beforehand.
